

OUTRIGGER KITS

Need to start the build on a body and not sure if the outrigger is going to be manual or hydraulic? No problem, we have a solution!

Our new 40K ft-lb and 72K ft-lb outrigger kits provide a solution to the decision-making process during the production and product development cycles.

One center tube can be purchased and installed at the time of body construction. The same center tube can accept one of our manual or hydraulic outrigger kits. You no longer need to make the decision ahead of time, and can spare yourself the hassle of tying up capital in the early stages of the build.
